adiabatic limit ($k_r \to 0$)
(a) ORC evaporator composite curves
(b) the approach is worst in the interior
temperature, T / °C
cumulative duty / % of evaporator load
onset of boiling
pinch = 5.01 K
water (hot), $T_{2d} \to T_{3d}$
ORC working fluid (cold)
hot-end rule alone (infeasible)
approach, $T_{water} - T_{ORC}$ / K
$\Delta T_{pinch,ORC} = 5$ K
5.01 K at 16.0 %
