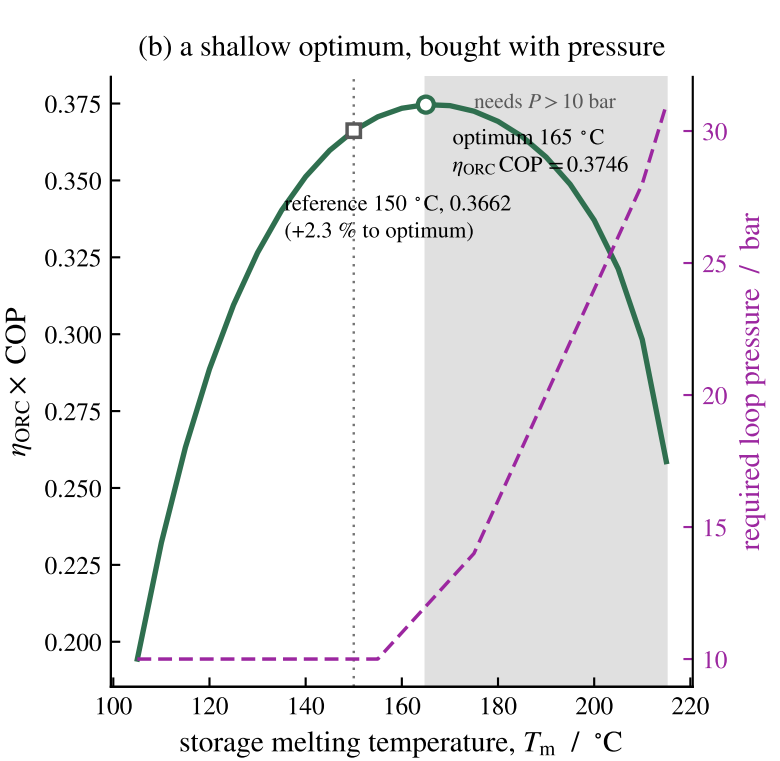
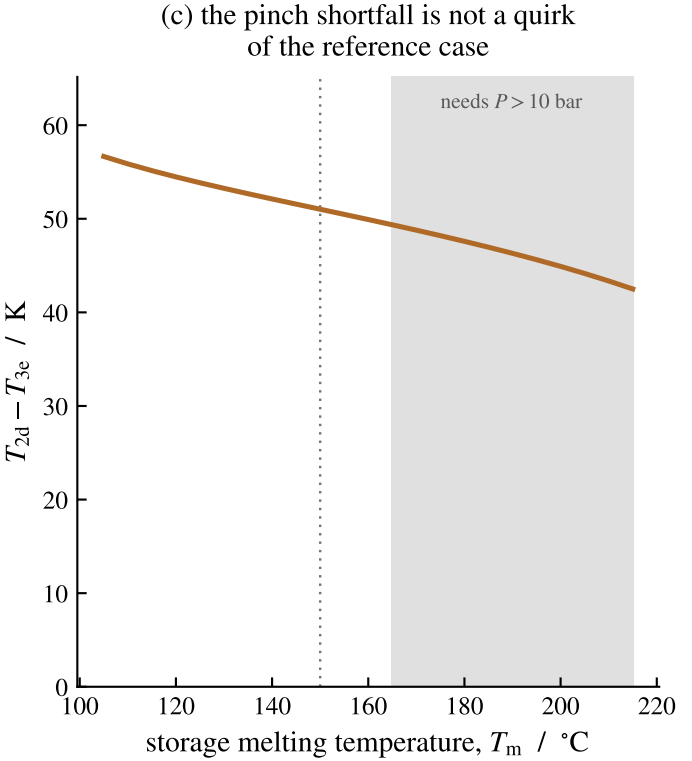
(a) the two machines pull opposite ways
needs $P > 10$ bar
η_{ORC}
COP
storage melting temperature, T_m / °C



(b) a shallow optimum, bought with pressure
needs $P > 10$ bar
optimum 165 °C
η_{ORC} COP = 0.3746
reference 150 °C, 0.3662
(+2.3 % to optimum)
$\eta_{ORC} \times$ COP
required loop pressure / bar
storage melting temperature, T_m / °C



(c) the pinch shortfall is not a quirk
of the reference case
needs $P > 10$ bar
$T_{2d} - T_{3e}$ / K
storage melting temperature, T_m / °C
